

Airport Modernization and Runway Refurbishment Consultancy Services

Challenges

Refurbishment of runways in operational airports will always be a challenge for their operators. The operational constraints and the level of refurbishment needed must be effectively coordinated. Refurbishment works must take place at night within a short time period during night curfew when the runway is closed.

The planning of the most effective technology and the quality assurance during the construction period is paramount to safeguard the future life span of the runway.

Some airports need to be completely closed during construction at night and/or need new RNP procedures to safeguard bad weather operation on a displaced threshold. During the construction phase the rescheduling of airline slots is particularly challenging.

Our Services

- Airport Modernisation Program for Runways and Taxiways during the operation
- Assessment of modernisation technologies
- General Project Management and Scheduling
- Feasibility Study and Design Services
- Procurement and Tender Process Management
- Construction Supervision Management
